

Submission and Scrutiny Readiness Pack

Non-proof-bearing companion to the manuscript package

Amos Jay Maley

March 22, 2026

Status

This document is intentionally *non-proof-bearing*. It does not alter the theorem or the live dependency chain of the manuscript *Carrier Universality and Global Smoothness for the Periodic 3D Navier–Stokes Equations*. Its role is to complete the submission-readiness record: target-journal choice, stress-test preparation, reproducibility freeze, errata posture, and public-scrutiny readiness.

1 Reader orientation

The live proof route should be read through the following seven-step spine: kernel necessity; ambient counterexamplehood as theorem-bearing construction; Fefferman proof/refutation-regime non-degeneracy; finite-horizon endpoint condition; Counterexample Soundness; endpoint-status exhaustion; and branch elimination. The manuscript’s length reflects theorem-local audit and objection control, not a change in the proof class. The standalone orientation file is bundled at `docs/orientation_spine.md`.

2 Clay-rule posture

Under the official Clay rules, direct submission to the Clay Mathematics Institute is not the route for a proposed solution. The operative track is: publication in a refereed mathematics venue of worldwide repute (or another form later deemed qualifying), followed by public mathematical examination and at least two years of general acceptance before prize consideration. This readiness pack therefore treats journal fit and public scrutiny as first-class operational tasks.

3 Recommended journal track

Outlet	Current public evidence	Why plausible	Recommendation
Archive for Rational Mechanics and Analysis	The Springer journal overview states that the journal publishes research of “exceptional moment, depth and permanence”; the 2026 editorial-board page is public and current.	Strong topical fit for fluid mechanics / PDE / analysis; strong reputation optics for a millennium-problem claim.	Primary target. Submit here first.
Analysis & PDE	MSP public pages state that the full editorial board votes on all articles and provide peer-review and editorial information.	Excellent specialist fit and very strong scrutiny optics for PDE-facing refereeing.	Backup A. Move here if the primary outlet declines.
Journal of the European Mathematical Society	EMS Press public pages remain current; the submission page explicitly notes that papers longer than 80 pages are encouraged toward the Memoirs of the EMS.	Outstanding prestige and worldwide-repute optics, but the current manuscript length is a real caution.	Backup B / stretch option. Use only if the length/timeline tradeoff is accepted.

Operational decision. The submission-readiness recommendation is: **submit first to ARMA**, keep **APDE** as the specialist backup, and treat **JEMS** as a prestige backup only if the author is comfortable with the current length issue and the likely longer editorial cycle.

4 Three skeptical reads before submission

The submission packet should not go out until three written skeptical reads have been completed:

1. **PDE analyst** — audits Part III, Appendix B, the official endpoint match, and the PDE-native admissibility / witness packet.
2. **Foundations / scope critic** — audits same-scope, admissibility, quotient / factorization, no-admissibility-dynamics, and the no-third-status closure.
3. **Generalist proof auditor** — audits the proof spine, appendix burden, theorem-local closure, and endpoint compression.

Each surviving objection must point to a named theorem, definition, appendix, or primitive assumption. The detailed packets live in `phase7_readiness/02-05`.

5 Source freeze, build scripts, and QA

This project includes:

- local build scripts in `tools/`,
- a frozen source-hash manifest in `phase7_readiness/06_source_manifest_sha256.txt`,
- a local build and QA report in `phase7_readiness/07_build_and_qa_report.txt`,
- a compact live theorem index and Clay-compatibility note in `phase7_readiness/13-14`.

These are not proof-bearing, but they materially improve reproducibility and trust.

6 Errata and public-response posture

The readiness pack also includes:

- a public errata policy,
- a theorem-local public response template,
- a post-publication scrutiny plan,
- a final submission decision checklist.

The governing rule is simple: no side note becomes proof-bearing. If a correction changes the proof, the manuscript itself changes and the source hash is refreshed.

7 Go / no-go rule

Do *not* submit until:

1. the three skeptical reads are on file,
2. the manuscript version and source hash are frozen,
3. the QA report is refreshed for that version,
4. the editor cover note is checked against the exact version being submitted.

The detailed checklist is bundled in `phase7_readiness/11_submission_go_no_go_checklist.md`.

Bottom line

This readiness pack does not change the mathematics. It changes the *publication posture*: the manuscript is paired with a current journal-target matrix, stress-test packets, a reproducible source freeze, and a public-scrutiny protocol appropriate for a serious proposed solution to a Clay problem.

Proof-class correction: method-neutral impossibility route

This readiness pack treats the manuscript as a constraint-formalism impossibility proof, not as a PDE-native continuation-estimate proof. Clay’s official rules require a complete mathematical solution to the official problem description; they do not prescribe a PDE-native method class. The correct stress-test protocol therefore targets kernel necessity, official-periodic non-degeneracy, finite-horizon endpoint-condition soundness, endpoint-status exhaustion, and branch elimination, rather than the absence of a conventional vortex-stretching estimate.
